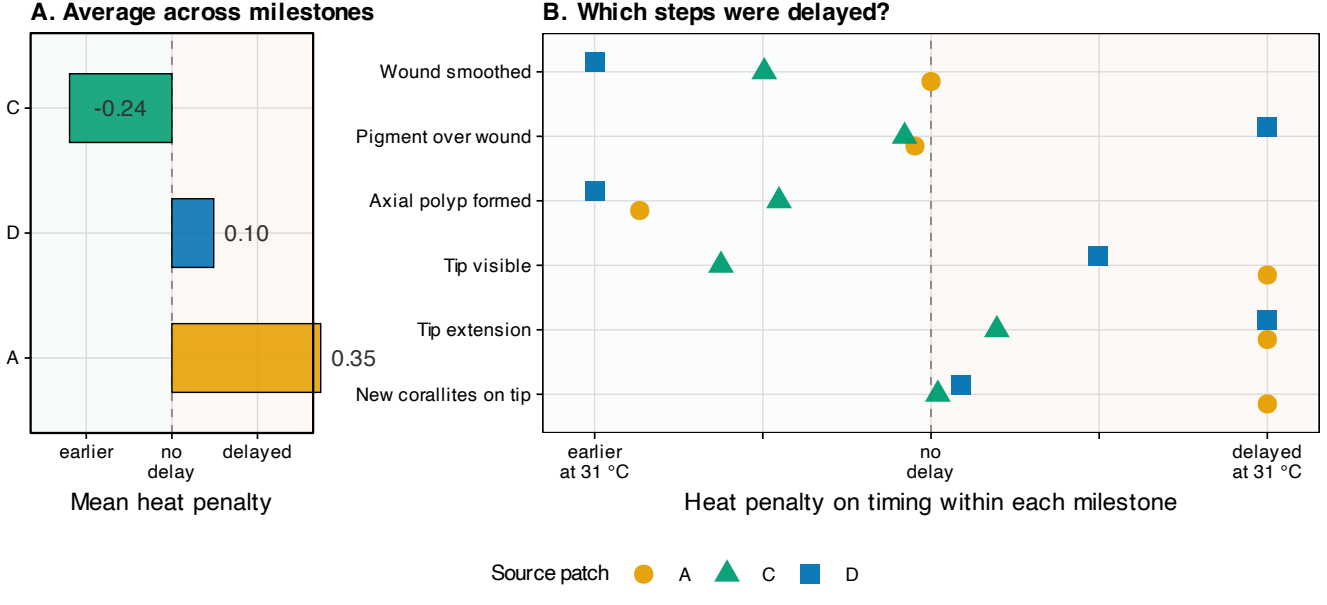
Estimated repair-timing penalties were smaller in source patch C

Dots left of the dashed line reached a milestone earlier at 31 °C; dots right of the line were delayed.
C clusters near no delay or earlier onset, while A and D show the largest delays for some steps.



Scores compare source patches within each healing/regrowth step after putting timing effects on a common scale. n = 8 wounded fragments per source patch and step (4 at 28 °C, 4 at 31 °C). Sparse pigment observations limit precision; these scores are exploratory.
