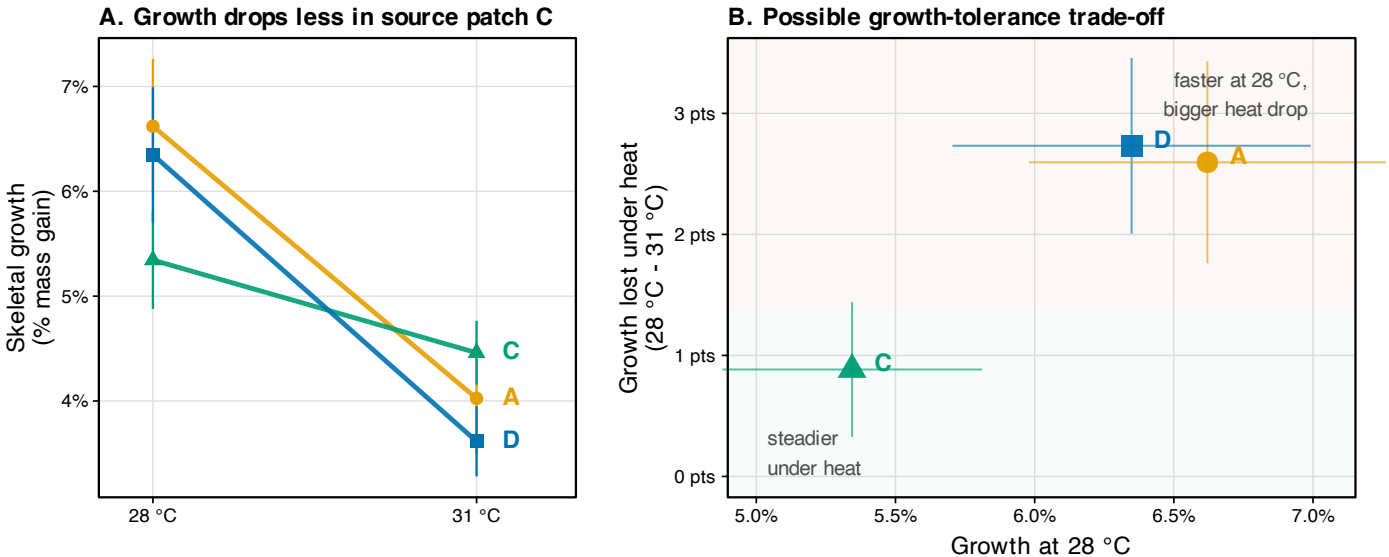
A possible growth trade-off, not yet a strong claim

Source patch C grew less at 28 °C than A or D, but it lost much less growth under heat. With only three source patches, this is a pattern to flag, not proof of an evolutionary or energetic trade-off.



Points are source-patch means from the end-of-experiment growth table; error bars show +/- 1 SE. A, C, and D are source-patch labels, not confirmed genetic individuals.
