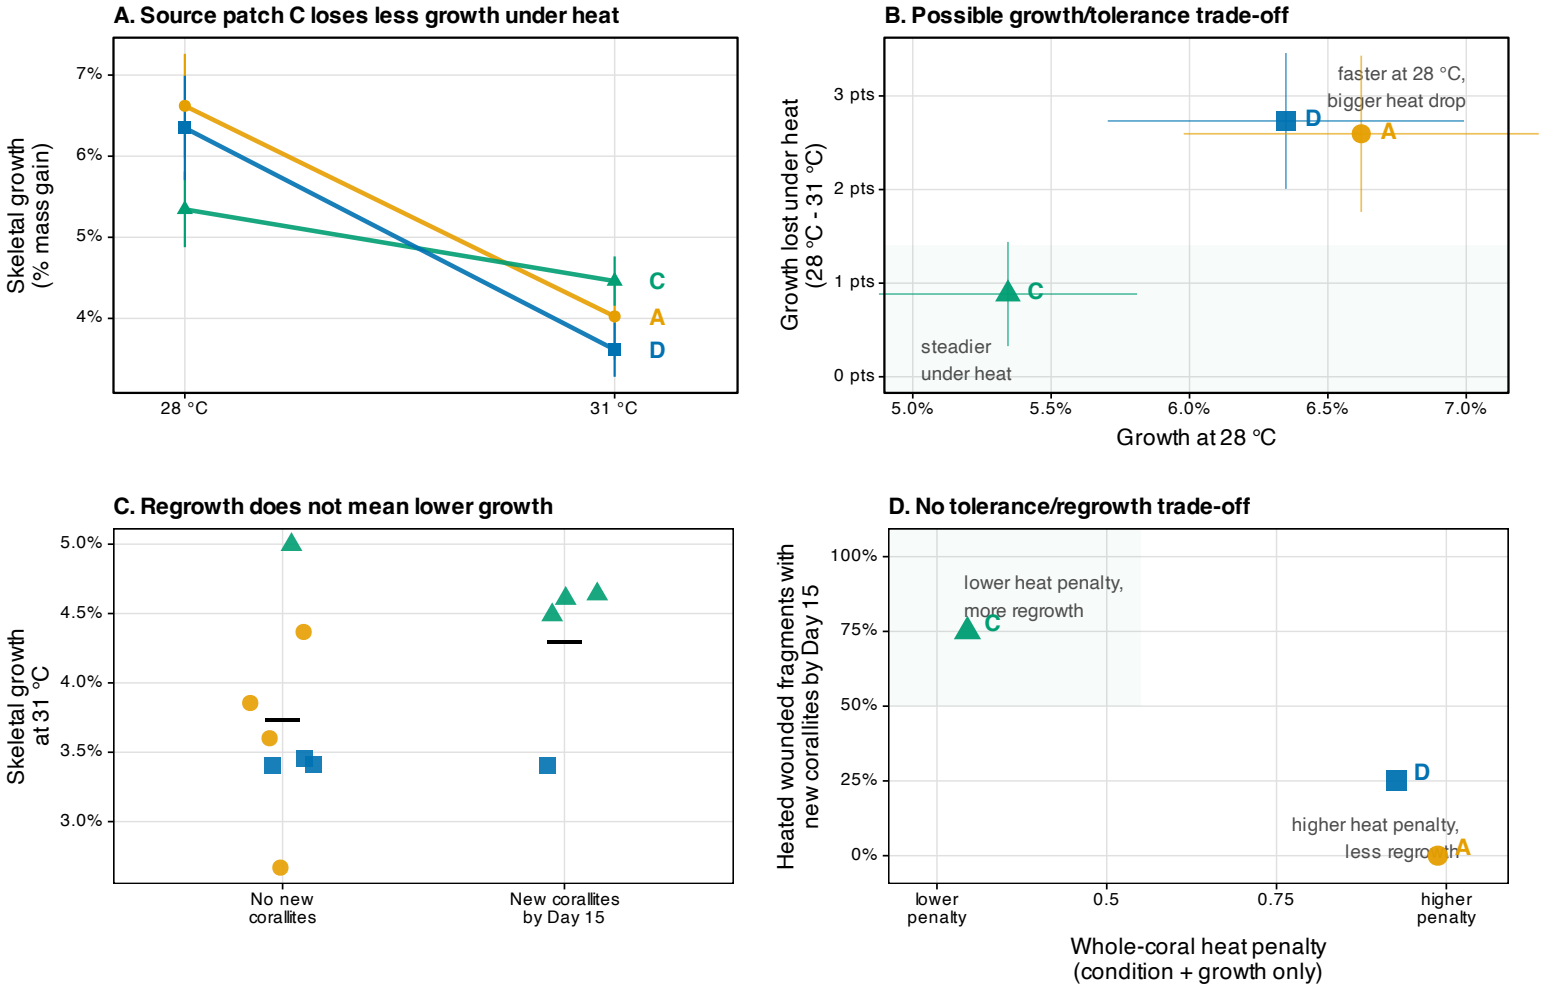
**Trade-off checks: one possible growth cost, no regeneration cost**

Source patch C grew less at 28 °C but lost less growth under heat. The regeneration checks point the other way: under heat, fragments and source patches with more regrowth did not show lower growth or higher heat penalty.



All panels are exploratory. Points are coral fragments in panel C and source-patch means in panels A, B, and D. Vertical bars in A and horizontal/vertical bars in B are standard errors (SE). Black ticks in C are group means. A, C, and D are source-patch labels, not confirmed genetic individuals.
