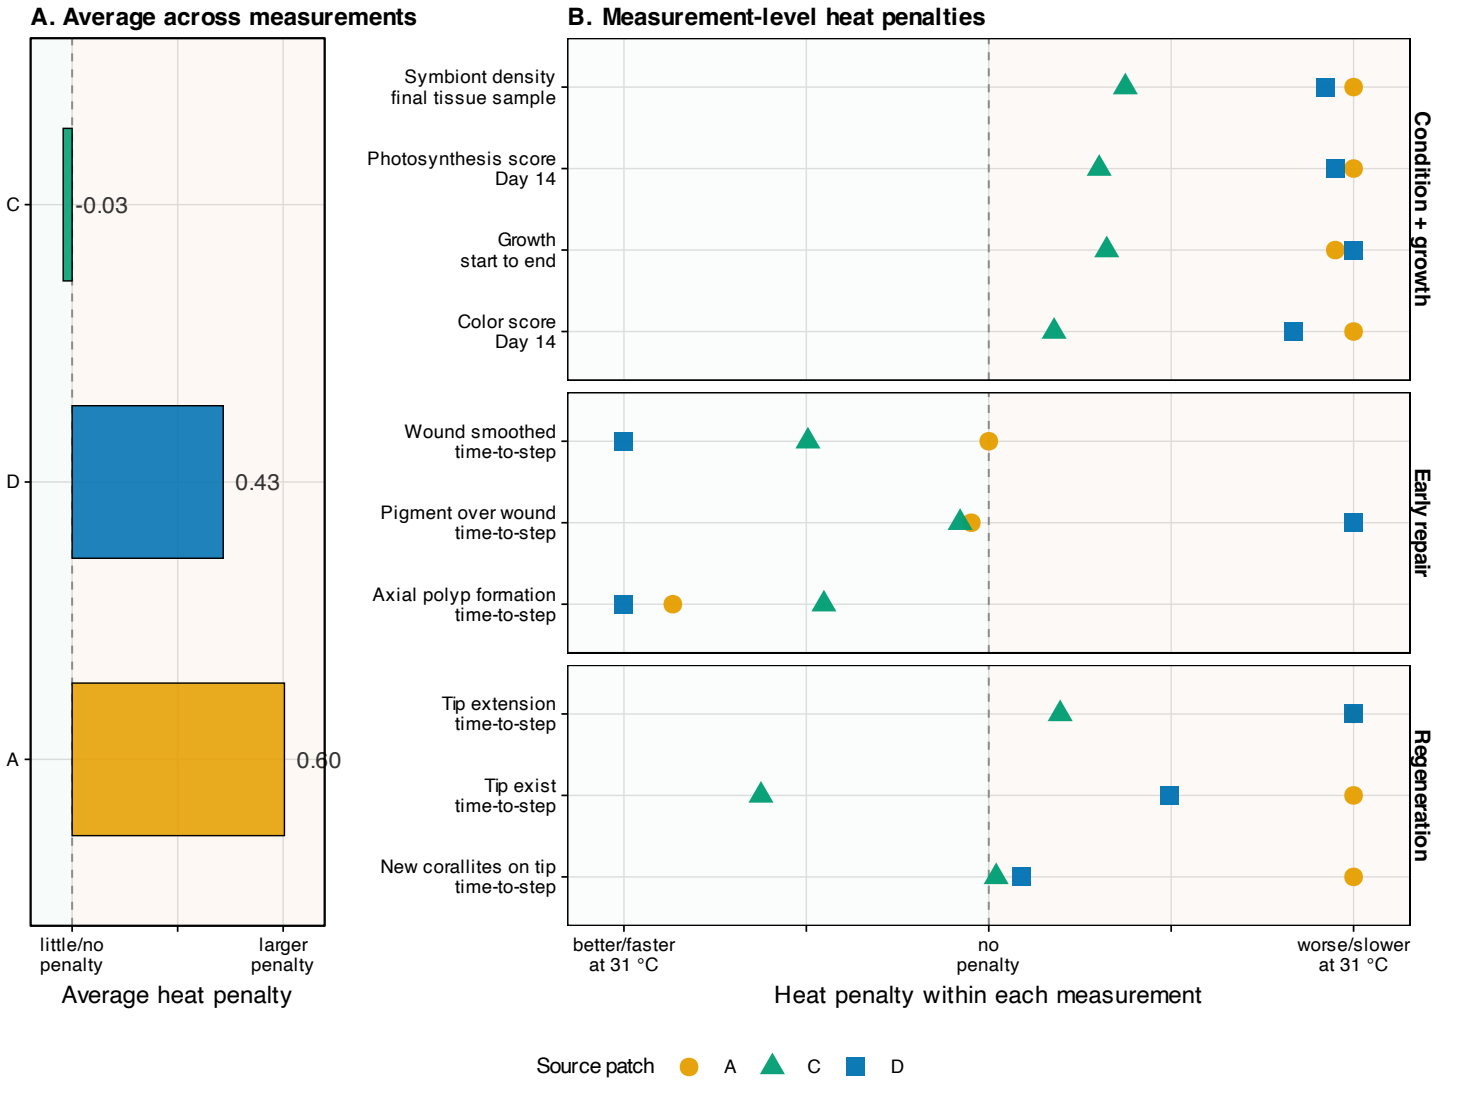
Source patch C is least harmed by heat

A, C, and D are source-patch labels, not confirmed genetic individuals. Each measurement is first converted to a 31 °C vs 28 °C heat penalty and put on a common 0-to-1 scale. C stays close to little/no penalty, while A and D show larger losses or delays.



Positive values mean worse whole-coral condition or slower healing/regrowth at 31 °C; negative values mean higher condition or faster healing/regrowth at 31 °C. Whole-coral measurements use final or full-study values averaged across wound state. Healing/regrowth measurements use wounded fragments and the time when each step appeared.
