Three ways to show healing and regeneration stage timing

All panels use the same stage-timing table.
Choose based on whether the priority is distribution, timing, or quick pattern recognition.

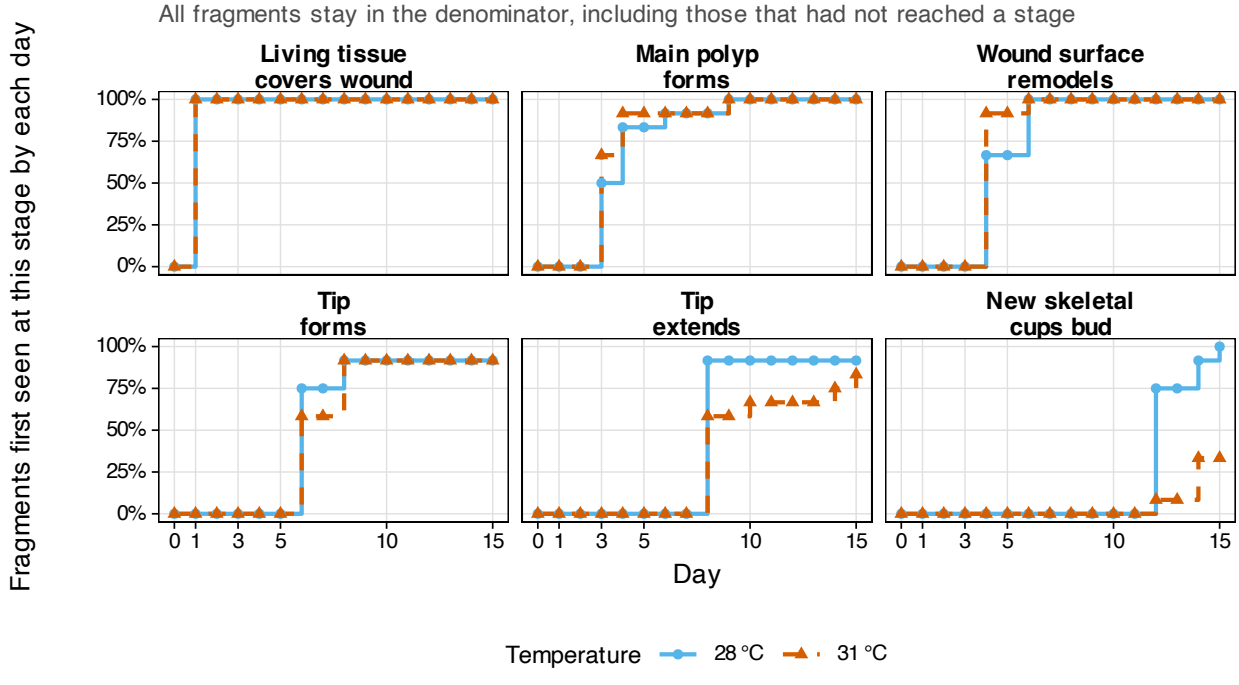

A. Count-scaled violins

Best for showing the distribution Molly asked for.

Fewer heated fragments reached the final regrowth step by Day 15

All fragments stay in the denominator, including those that had not reached a stage

Tissue cover: 8 fragments per temperature in a separate photo experiment, all covered on Day 1.
Other panels: 12 fragments per temperature in the main experiment.

C. Percent-reached heatmap

Best for a compact table-like summary.
