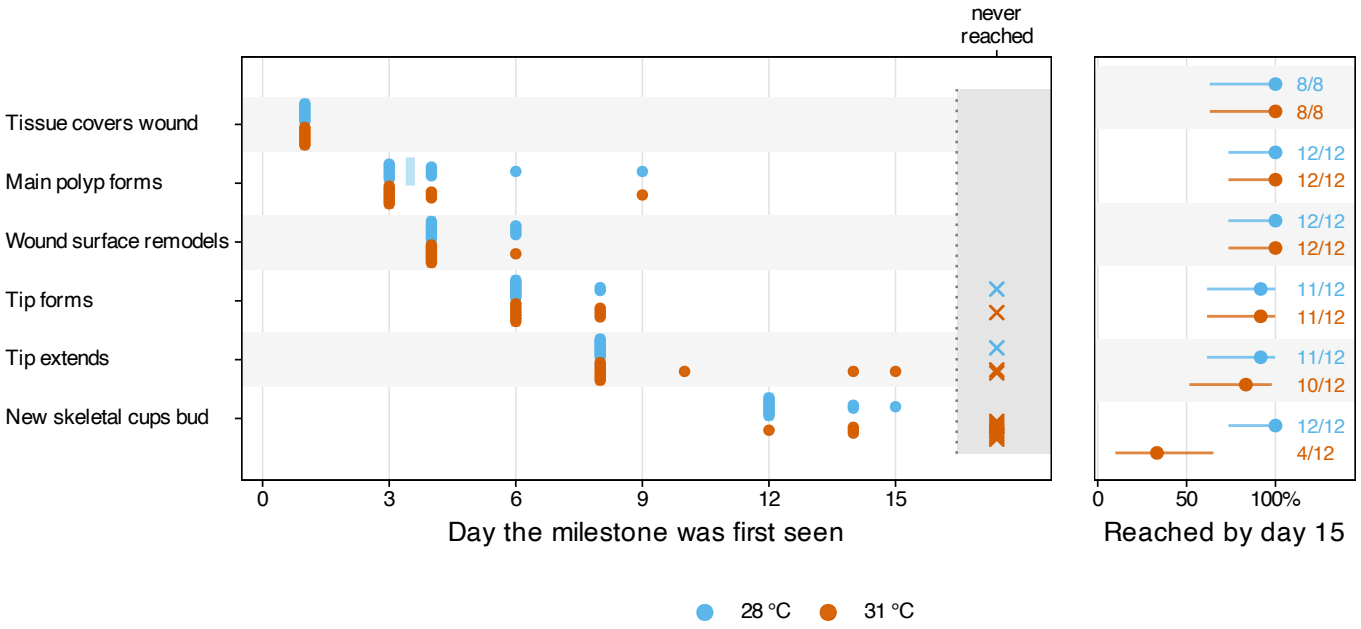
Heat blocked the last regeneration milestone, not the earlier ones

Each point is one wounded fragment. Crosses are fragments that never reached the milestone by day 15 and stay in the denominator. Vertical ticks mark the median day, drawn only where at least 80% of the group reached the milestone.



Top row is the 16-fragment microscope cohort (8 per temperature); the other five are the main cohort (12 per temperature).
Bars are 95% binomial intervals. Milestones are numbered but are not strictly nested: 3 of 24 fragments recorded one out of order.
